

USER GUIDE

Scheduler+

Visual scheduling for lights, switches, and climate devices in Home Assistant — for building managers, no technical background required.

SECTION 1

Overview & the schedule list

Scheduler+ is a card on your Home Assistant dashboard. Each row is a **schedule** — a named set of on/off rules for one or more devices (lights, switches, or a thermostat). This is the screen you'll come back to most.

The Scheduler+ card as it appears on your dashboard.

Each row shows, left to right:

- An **on/off switch** — enables or disables that whole schedule immediately, without opening it.
- The **name**, followed by its device type, entity count, and rule count (e.g. "Switch · 1 entity · 1 rule").
- A status line underneath, when relevant — **Next: On Fri, 6:00 AM**, an "Inactive until..." note, or a "Paused through..." note (more on these in later sections).
- Row actions on the right: **Edit**, **Duplicate**, **Pause/Resume**, and **Delete**.

The four icons in the card's header are shortcuts, covered in their own sections below:

ICON	OPENS
 	My preferences — your own weekday/weekend/working-hours defaults (§8)
 	Day view — a read-only report of what's scheduled on a day or week (§7)

ICON	OPENS
	Quick event — a fast one-off on/off for a single date (\$6)
	From template — start a new schedule from a saved template (\$9)

To add a brand-new schedule, use the **Add schedule** button at the bottom of the card.

SECTION 2

Creating a schedule

A schedule ties one or more devices to one or more rules. Click **Add schedule** to open the editor.

×

Add schedule

Save

The Add schedule dialog. Every field here applies to the whole schedule; rules (added separately) define when things actually happen.

- 1 **Name** the schedule something a colleague would recognize at a glance — "Office lights", "Office AC", "Front Hallway Evening".

- 2 Choose the **Device type**: *Lights & Switches* or *Climate*. This determines which entities you can pick and which action options appear later when you build a rule.

Device type — pick this once; you can't change it after the first save.

- 3 Leave **Enabled** on (the default) unless you're building this ahead of time and don't want it to run yet.

- 4 Leave **Active period** at "Always active" for a normal, year-round schedule. This field is for seasonal schedules — see §4.
- 5 Use the **Entities** search box to find and check off the devices this schedule should control, then click **Add selected**. You can select several at once.
- 6 Click **Add rule** to define when things turn on and off — see §3. A schedule with no rules does nothing.
- 7 Click **Save**.

SECTION 3

Adding rules

A rule says: on these days (or dates), turn on at this time, turn off at that time, and do this action. A schedule can have several rules — for example, one for weekdays and a different one for weekends.

×

The top of the Add rule dialog.

Name, enabled, and starting from a template

Give the rule a short name ("Weekday hours", "Weekend"). The **Start from template** button at the top lets you pre-fill everything below from a rule you've

saved before — see §9.

Days

Tap individual day chips, or use a preset: **Every day**, **Weekdays**, **Weekend**, or **After hours** (fills in your own working-hours start/end from My Preferences, §8). "Weekdays" and "Weekend" use *your own* saved day split from My Preferences, not a fixed Mon–Fri assumption.

Date filter

By default a rule's **Date filter** is "Always" — it just follows the Days above, every week, forever. Changing it opens a panel with three more options:

×

Save

The date filter panel, expanded.

- **Always** — follows Days every week, no exceptions.
- **Only on these dates** — the rule ignores Days entirely and fires *only* on the exact dates, date ranges, or special conditions you list. Good for one-off events or holiday hours.

- **Except these dates** — the rule follows Days as normal, but skips any date you list. Good for "run every weekday, except during winter break."

Inside that panel you can add:

- **Specific dates** — individual calendar days.
- **Date range** — a start and end date, inclusive.
- **Special conditions (YidCal)** — Shabbos, Yom Tov, Erev Shabbos, or Erev Yom Tov, driven by your YidCal calendar integration instead of fixed dates.

GOOD TO KNOW

A YidCal condition can only be confirmed for *today* — so you won't see it listed under "Next event" on the card ahead of time, but the rule still fires correctly once that day actually arrives.

Time

Each rule has an **On time** and an **Off time** — you can turn either one off if you only want the rule to act on one side (see below). Each side's time can be:

- **Fixed time** — a specific clock time, e.g. 6:00 AM.
- **Sunrise / Sunset** — with an optional offset in minutes (e.g. "Sunset – 15").
- A **YidCal zman** (הדלקות הנרות / מוצש"ק) — also with an optional offset, if your YidCal integration is set up.

ON-ONLY AND OFF-ONLY RULES

Turning off the On time or Off time switch makes the rule act on only that one side — useful for a rule that should just turn something off at a set time without ever turning it on (a curfew rule), or vice versa.

Action

What happens depends on the schedule's device type:

- **Switches** — nothing to configure; the rule just turns the switch on and off.
- **Lights** — turns on at whatever brightness the light was last set to, by default. Optional toggles let you pin a specific **brightness** or a gradual **fade-in**

instead — most schedules don't need these.

- **Climate** — choose the **HVAC mode** (Heat, Cool, etc.) and, optionally, a specific **target temperature**. There's also an **Allow override** toggle:

Action section for a Climate schedule.

ALLOW OVERRIDE

With **Allow override** on (the default), someone can walk up to the thermostat and change it, and it'll simply stay that way until the next scheduled event. Turn it **off** and the rule will keep enforcing its own setting for as long as it's active — if someone manually changes the thermostat, Scheduler+ waits a short grace period and then puts it back.

SECTION 4

Active period (seasonal scheduling)

This is a schedule-level setting (not per-rule) for schedules that should only run during part of the year — "Summer Hours" vs. "Regular Hours" sharing the same rooms.

×

Add schedule

Save

The Active period dropdown, in the Add/Edit schedule dialog.

- **Always active** — the default; no seasonal restriction.
- **Only during these date ranges** — the whole schedule is dormant except during the range(s) you add.

- **Except during these date ranges** — the whole schedule runs as normal except during the range(s) you add.

A schedule that's currently outside its active period shows an **"Inactive until ..."** note on the card instead of a "Next event" line, so it's obvious at a glance why it isn't doing anything right now.

TIP

Pair two schedules on the same rooms — one set to "Only during" your summer range, one set to "Except during" that same range — instead of hand-editing one schedule's times twice a year.

SECTION 5

Editing, duplicating, pausing, deleting

Editing

Click the pencil icon on any schedule row to reopen the editor. All the same fields from §2–§4 apply.

Save

Editing an existing schedule — note the Rules list now shows the saved rule, with its own on/off toggle and Edit/Delete icons.

Once a rule is saved, its row shows a compact summary (days and times) plus its own switch, so you can disable just that one rule without touching the rest of the schedule.

Duplicating

Click the duplicate icon to open a *new* schedule pre-filled with the same device type and rules as the one you clicked — handy for cloning a setup to another room. Nothing is saved until you edit the entities/name and click Save, so duplicating never affects the original.

Pausing

Sometimes you need to suppress a schedule temporarily — a snow day, a one-off closure — without touching its rules or remembering to turn it back on. Click the pause icon.

A modal dialog box titled "Pause 'Test'" with a close button (X) in the top left. The text inside reads: "Suppresses this schedule entirely through the date below, then resumes automatically the next day - nothing to remember to turn back on." Below this is a label "Paused through" followed by a date input field containing the placeholder "mm/dd/yyyy" and a calendar icon. At the bottom right are two buttons: "Cancel" and "Pause".

×

Pause "Test"

Suppresses this schedule entirely through the date below, then resumes automatically the next day - nothing to remember to turn back on.

Paused through

mm/dd/yyyy

Cancel Pause

The Pause dialog.

Pick the last date you want the schedule suppressed through, and click **Pause**. The schedule resumes automatically the following day — nothing to remember. While paused, the card shows a "**Paused through ...**" note, and the pause icon becomes a **Resume** icon (▶) for a one-click early resume.

A paused schedule shows a "Paused through" note and a Resume (▶) icon in place of Pause.

Enabling / disabling

The switch on the left of each row is the fastest way to turn a whole schedule off or on. Unlike Pause, this has no end date — it stays off until you flip it back.

Deleting

Click the trash icon and confirm. This is permanent — there's no undo.

SECTION 6

Quick events

For a one-off "just today" need — like keeping the gym lights on late for an event — Quick event skips the full Add schedule flow.

×

Quick event

A one-off on/off for a single date - lights and switches only. For climate or a recurring schedule, use Add schedule instead.

Name

Event – 2026-08-04

Create

The Quick event dialog, opened from the calendar-plus icon in the card header.

- 1 Pick the entities.
- 2 Optionally rename it (it defaults to "Event – [date]").
- 3 Pick the date and the on/off times.
- 4 Click **Create**.

LIGHTS AND SWITCHES ONLY

Quick event is scoped to lights and switches, with no brightness/fade options. For a one-off climate change, or anything recurring, use **Add schedule** instead.

Under the hood a Quick event is just a normal schedule with one rule for one date — it appears in the regular schedule list afterward, and you can edit or delete it like anything else. It doesn't clean itself up automatically once its date has passed, so it's worth deleting old ones occasionally.

SECTION 7

Day view & week view

A read-only report answering "what's actually going to happen, and when" — across every schedule, grouped by device type. Opened from the calendar-clock icon.

Save

My preferences — per-user, not shared with anyone else.

THIS IS PERSONAL, NOT SHARED

Every signed-in user has their own copy of these settings. If a colleague's "Weekdays" preset fills in different days than yours, that's expected — it's each person's own saved preference, not one shared organization-wide default.

SECTION 9

Templates

Templates let you save a rule — or a whole schedule's worth of rules — and reuse it later without rebuilding it from scratch.

Saving a template

Both the rule editor and the schedule editor have a **Save as template** button at the bottom. Saving from the *rule* editor stores just that one rule, reusable later via **Start from template** inside any other rule of the same device type. Saving from the *schedule* editor stores the whole rule set, reusable via **From template** on the card header when starting a new schedule.

Using a template

From template (card header) shows your saved schedule templates with a **Use** button — picking one opens the normal Add schedule dialog pre-filled with that template's rules, so you still add the entities and review everything before saving. **Start from template** (inside the rule editor) works the same way for a single rule.

SCREENSHOTS COMING

This section will get walkthrough screenshots of both dialogs in a future update to this guide.

SECTION 10

Overlap warnings

When you save a schedule, Scheduler+ checks whether any of its rules would overlap with a *different* schedule on a shared device — for example, a daily "off at 4pm" rule that would undo a one-off event wanting the same light on until 11pm.

If an overlap is found, a warning appears before the save completes, listing:

- Which other schedule and rule it overlaps with, the date, and the affected devices.
- Where possible, a one-click **Exclude "[schedule]" on [date]** button — this adds a date exception to the *other* schedule so it steps aside for that one day, then saves automatically.
- A **Save anyway** option if you want to proceed regardless.

WHAT THIS DOESN'T CATCH

The check looks about two weeks ahead for regular recurring schedules (and at the exact dates for one-off ones). A conflict that would only show up in a different season — say, a sunrise-timed rule that only overlaps a fixed-time rule in winter — won't be flagged until closer to that date.

SCREENSHOT COMING

A walkthrough screenshot of the warning panel will be added to a future update to this guide.

Status notes on a schedule row

TEXT	MEANING
Next: On Fri, 6:00 AM	The soonest upcoming on/off moment across all of this schedule's rules
Inactive until Jul 1	Currently outside its Active period seasonal window (§4)
Paused through Aug 19	Manually paused (§5) — resumes automatically the day after

Glossary

Schedule	A named group of entities plus one or more rules.
Rule	One on/off pattern within a schedule — days or dates, on/off times, and an action.
Entity	An individual device — one light, one switch, one thermostat.
Template	A saved, reusable rule or rule set, with no entities of its own.

Scheduler+ User Guide. Sections 9 & 10 will be updated with screenshots as they become available.
